

Gas has been blowing out in the present hot spring area from the time when there were no visitors.

A company focused on the potential of underground resources came to the survey.

The oil exploration began in 1914, and the following year in 1915, when the oil exploration reached 960m, natural gas and hot springs spouted with a loud noise. This was the beginning of Toyotomi Onsen

The feature of this hot spring is that it contains oil. It is an oil hot spring that is rare in Japan and around the world. (It seems that this is because it is ejecting from the well along with oil and natural gas)

(efficacy)

- |                            |        |
|----------------------------|--------|
| Chronic skin disease       | Bruise |
| Recovery from fatigue      | scald  |
| Neuralgia                  |        |
| Joint pain                 |        |

| Postpartum recovery period |        |
| Hemorrhoids                |        |
| Chronic digestive disease  |        |
| sprain                     |        |

The oil content in hot water is effective against skin diseases, and it has been shown to have an effect on psoriasis vulgaris and atopic dermatitis

In 2015, it was selected as one of the 100 famous hot springs as a hot spring area with a highly effective spring quality recommended by a hot spring therapist.
